

TIGERZ11 TWO SPEED WINCHES & COMPETITION WINCH

PPCB is the description of the improved structure of the carbon brush frame.

Based on this improved carbon brush frame,

The carbon brushes will always touch the motor rotor fully even in the case of

Being worn out after a certain period of use.

If the carbon brushes were not able to make full contact with the motor rotor

Then it would be the case of the brushes being worn out,

it may cause a power lose to the winch motor.

Power leads that are loose are also an indictor to lose of power and pulling
power decrease.

Also,PPCB allows a longer carbon brush to ensure longer life span.
